## ABSTRACT:

PURPOSE: To obtain a pharmaceutical composition having high transcutaneous or transrectal absorptivity, by using a specific compound in combination with an unsaturated sesquiterpene alcohol as a transcutaneous absorbefacient, and using a dihydropyridine-type Ca-antagonist as an antisthenocardia and hypotensive agent.

CONSTITUTION: The objective composition contains (A) a transcutaneous absorbefacient consisting of (a) one or more compounds of formula I or formula II (R1~3 are lowr alkyl) and (b) an unsaturated sesquiterpene alcohol composed mainly of (±)-α-bisabolol and (B) a dihydropyridine-type Ca-antagonist (e.g. nivadipine, nifedipine, etc.). The compound of formula I is e.g. N-methyl-2- pyrrolidone, etc., and the compound of formula II is e.g. 1,3-dimethyl-2- imidazolidinone. The combined use of the compounds (a) and (b) remarkably improves the compatibility to the drug, and the transcutaneous and transrectal absorption of the drug, and enables the use as an agent for external application or rectal administration.
